of digital transformation, enterprise data is
growing exponentially. The volume of data
within enterprises is growing exponentially.
But more than numbers, data's usefulness is
determined by the insights it provides to
help business users make better, faster,
more informed business decisions. With a
growing number of data sources and a
growing volume of data, the challenge for
traditional data analytics platforms is how to
extract the intelligence from data. It is only
when the truth is buried in the complexity of
multiple types of data that it can be
uncovered. The analyst's role must evolve to
that of the curator; transforming data into
valuable information and insight. As
enterprise data grows exponentially, the
volume of data insights provided by

traditional data analytics platforms keeps trailing behind to a very slow pace. The explosive growth of enterprise data presents a challenge for traditional data analytics platforms. Traditional data analytics platforms come with many functionalities designed to generate insights from numbers that not only overwhelm the user with voluminous results, but also require endless manual and scripted effort to process data to reach a single and trustworthy conclusion. The current data analytic environment is inefficient because the data coming from myriad sources is not at the same stage of maturity, and data from various sources at any stage has different kinds of inaccuracies. Traditional data analytics platforms are not able to consolidate information from multiple sources, and the analysis of this consolidated data is an enterprise-wide effort. Hadoop has been open-sourced and is now a well-proven and widely deployed open source technology. Hadoop is a software framework for computer processing of very

large datasets. It is used as a foundation for storing, processing and analyzing large amounts of data, using the paradigm of storing data on a cluster of commodity hardware, making it possible to harness the parallel processing power of a cluster of servers. Hadoop is a powerful framework for storage and analysis of data on a large cluster. Hadoop comes with its own database called Hadoop Distributed File System (HDFS) that allows the organization of data into a set of files that are distributed across the cluster. All data is stored as a series of key/value pairs, with each key referring to a piece of information and the value indicating the value of the piece of information. The data stored in 6d1f23a050
